ATLAS-7

THE VALIDATION ROOM

An immersive model risk validation simulation

Five days. Forty hours. One decision with consequences.

A Richard LeClezio experience

Models make decisions. Who validates the validators?

- A credit model touches 31,000 lives every month
- SR 11-7 requires effective challenge, not a checkbox review
- The gap between knowing the statistics and making the call under pressure
- ATLAS-7 closes that gap with a simulation that scores judgment

Every model has a blind spot. Find it before it ships.

Five days. Forty hours. Eleven defect areas.

- Seeded case generation: same code = same truth = fair comparison
- 456,976 unique cases with different defect mixes
- Tests, charts, threshold strips, follow-ups, daily events
- A scored debrief with answer key and six-month consequences

Five days, each with its own pressure.

- Monday: Brief the case, interview developers, run first tests
- Tuesday: Business demands a preliminary green light
- Wednesday: The vendor offers documentation under NDA
- Thursday: The CRO asks if anything should go to committee early
- Friday: Developer challenges your top three findings. Then you decide.

Every test produces a real exhibit.

- Charts, measured results, and threshold strips for every test
- Three zones: within tolerance, watch band, breach
- Watch-band readings are where judgment and follow-ups matter
- Follow-ups cost 1-3 hours but can resolve ambiguity

Five dimensions.
One hundred points.

- Findings and severity: 50 pts. Did you find what was there?
- Precision: 10 pts. Three off per false alarm
- Developer challenges: 10 pts. Hold what the evidence supports
- Validation opinion: 20 pts. Does your call fit reality?
- Conduct: 10 pts. Independence and early escalation

The answer key.
The consequences.

- A cinematic reveal with your validation score and radar profile
- Full answer key: reality vs. your calls, with points breakdown
- Six-month consequences for every missed or misrated defect
- A committee memorandum generated from your findings

The memo is downloadable. Same case across a team to compare.

Built for the people who own the decision.

- Model validators: practice effective challenge without production risk
- MRM leaders: calibrate teams with the same case code
- Developers: see the model through second-line eyes
- Audit and examiners: rehearse what a defensible file looks like

Zero dependencies.
Pure web.

- No backend, no login, no data collection
- Runs from a single HTML file in any browser
- Seeded generation: same code = same truth, 456,976 unique cases
- Progress saved locally, printable memo, responsive on all devices

Deploy to Vercel, Netlify, or any static host in under a minute.

THE FILE IS OPEN

ATLAS-7 decides 31,000 loans a month from Monday.

Unless you find a reason it should not.
